Transportation Power Infrastructure

Design, build, commission - our approach provides maximum client and partner flexibility

RPS has a long history of supplying products and services that meet the power infrastructure needs of regional and long haul Transit Operators. We work in partnership railroad operators and their partners including architects, engineers and construction companies to provide the electrical power, control and protection products, engineering and design services that are specific to the transportation market.

RPS offers a full portfolio of services that delivers complete traction power system solutions – covering any or all aspects of design, build and commissioning for our customers. We employ a very experienced staff of substation and relay engineers. Our experienced team helps reduce the risk of failure due to unfamiliarity with unique transit and regional utility requirements.

In addition, we have experience with railway electrification systems as used by many older system operators. To support our regional transit customers, we have successfully delivered several 25Hz, protection and control systems, control houses and indoor and outdoor substation circuit breakers capable of meeting regional specifications.

Our team of project managers, engineers and technical specialists can manage your project from start to finish, covering green field, rebuilds, or upgrades to your power systems. By using our project management services, you'll have a single point of contact — minimizing the risk of miscommunication, project delays or cost overruns. The result will be a safer, more reliable, and cost-efficient power system.
